

MPETA Web Site

Are your dropdowns hanging low and you can't pull them up?

from Stephen Bubnowicz Public Relations and Technology Chair

Our web site may not be displayed correctly or work correctly in **your Windows Internet Explorer 8**. *This problem does not occur in earlier versions of Internet Explorer*. Our and many other affected Web sites continue to be displayed correctly and to work correctly in Windows Internet Explorer 7. Microsoft has not addressed this problem yet (and may never do so).

For example, you may experience any of the following symptoms in Internet Explorer 8:

- Menus, images, or text are in the wrong positions on some Web sites.
- Some Web site features do not work.
- You receive script error messages on some Web sites.
- Internet Explorer stops working or crashes on some Web sites.

Internet Explorer 8 includes a Compatibility View feature that displays Web sites that were created for older browsers as they were designed to appear. You can enable Compatibility View in Internet Explorer or on the Web server.

- Enable Compatibility View for a single computer. To do this, try **Method 1** for each Web site that is not displayed correctly or that does not work correctly. If this problem occurs on many Web sites that you frequently visit, you can enable Compatibility View for all Web sites by using **Method 2**. These methods are intended for users who are running Internet Explorer.

Enable Compatibility View in Internet Explorer

Method 1: Enable Compatibility View for specific Web sites by using Internet Explorer

To enable Compatibility View for specific Web sites that are not displayed correctly or that are not working correctly, follow these steps:

1. Open the Web site that is not displayed correctly or that does not work correctly in Internet Explorer 8.
2. Click the **Compatibility View** button that is located directly to the right side of the address bar next to the **Refresh** button.

Or, on the **Tools** menu, click **Compatibility View**.

Note If the **Compatibility View** button does not appear to the right side of the address bar, or if the command is not available on the **Tools** menu, you cannot use this method. You may be experiencing a different problem, or the network administrator may have used a Group Policy setting to configure the Compatibility View settings on your computer.

Compatibility View is not required, and the Compatibility View commands will not be available if the Web site was designed for earlier versions of Internet Explorer. If this method worked, and the Web site is now displayed correctly and works correctly, you are finished. However, you may have to repeat this method for each Web site that experiences these problems.

Note When you use this method to fix a Web site, Internet Explorer saves your Compatibility View setting for that Web site. Every time that you visit that site, Compatibility View will be used. To stop a Web site from running in Compatibility View, repeat this method by clicking the **Compatibility View** button again for that Web site. You can also add or remove specific Web sites from Compatibility View without actually visiting each Web site. To do this, click **Tools**, and then click **Compatibility View Settings**.

If this method did not work, and the Web site is still not displayed correctly or still is not working, you are experiencing a different problem.

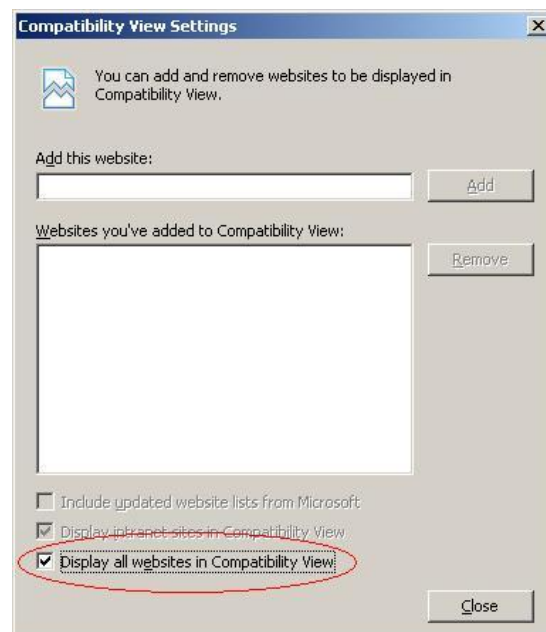

Method 2: Enable Compatibility View for all Web sites by using Internet Explorer

Most Web sites that you frequently visit are not displayed correctly or are not working correctly. You have tried Method 1 on some of these Web sites, and that method worked. However, you may want to enable Compatibility View for all Web sites. To do this, follow these steps:

1. Start Internet Explorer 8.
2. On the **Tools** menu, click **Compatibility View Settings**.

If **Compatibility View Settings** is not available, the network administrator may have used a Group Policy setting to configure the options for you. Contact your administrator or the help desk.

3. Click to select the **Display all websites in Compatibility View** check box, and then click **Close**.

Visit several Web sites that were not displayed correctly or that were not working to see whether the problem is now resolved.

If this method worked, and all Web sites are now displayed correctly and work correctly, you are finished.

If this method did not work, and some or all of the Web sites are still not displayed correctly or are not working, you are experiencing a different problem.
